Permanganate is used in industrial wastewater systems to oxidize organic and inorganic pollutants. These pollutants include but are not limited to sulfides, mercaptans, chlorinated solvents (trichloroethylene, perchloroethylene, and vinyl chloride), cyanides, phenols, chelated metals, aldehydes, olefins, organic sulfur compounds, amines, and other oxidizable compounds. Permanganate reacts over a wide pH range and requires no additional catalyst.

These problems can occur during chemical production, in food processing, soil and groundwater remediation, oil refining, mining, pulp and paper production, textile manufacturing, at a wide variety of industrial facilities.

Aqueous permanganate solutions are applied in wastewater treatment systems, usually ahead of the coagulation, settling, or filtration process. Insoluble manganese dioxide (MnO₂) is formed as an oxidation by-product and may have to be removed prior to discharge to the sanitary sewer or receiving stream. Laboratory tests are performed to determine the dosage of permanganate necessary to oxidize the target pollutant and reduce the concentration to acceptable levels. In most cases, no pH adjustment is necessary.

Permanganate can completely oxidize phenols and other organic pollutants. It may not be necessary to satisfy the permanganate demand of the wastewater to effectively fragment the organic to a non-toxic, non-hazardous reaction co-product.

The manganese dioxide formed will, by adsorption, assist in removal of many organic and inorganic pollutants.

Carus Chemical Company, Industrial Waste Treatment, Carus Form # CX 5505 (1998)

For further information on CAIROX® potassium permanganate or CARUSOL® liquid permanganate product characteristics and availability, contact Carus Corporation at 1-800-435-6856.
OTHER APPLICATIONS

- Drinking Water Treatment
- Wastewater Treatment

LABORATORY SUPPORT

Carus Corporation has technical assistance available to answer questions, evaluate treatment alternatives, and perform laboratory testing. Our laboratory capabilities include; treatability studies, feasibility studies, and analytical services.

FIELD SERVICES

As an integral part of our technical support, Carus provides extensive on-site treatment assistance. We offer full application services, including technical expertise, supervision, testing, and feed equipment design and installation in order to accomplish a successful evaluation and/or application.

CARUS CORPORATION

During its more than 100-year history, Carus’ ongoing reliance on research and development, as well as its emphasis on technical support and customer service, have enabled the company to become the world leader in permanganate, manganese, oxidation, and base-metal catalyst technologies.
